

How to use the STEVAL-STWINKT1 SensorTile Wireless Industrial Node for condition monitoring and predictive maintenance applications

Introduction

The STWIN SensorTile wireless industrial node (**STEVAL-STWINKT1**) is a development kit and reference design that simplifies prototyping and testing of advanced industrial IoT applications such as condition monitoring and predictive maintenance.

The kit features a core system board with a range of embedded industrial-grade sensors and an ultra-low-power microcontroller for vibration analysis of 9-DoF motion sensing data across a wide range of vibration frequencies, including very high frequency audio and ultrasound spectra, and high precision local temperature and environmental monitoring.

The development kit is complemented with a rich set of software packages and optimized firmware libraries, as well as a cloud dashboard application, all provided to help speed up design cycles for end-to-end solutions.

The kit supports BLE wireless connectivity through an on-board module, and Wi-Fi connectivity through a special plugin expansion board (**STEVAL-STWINWFV1**). Wired connectivity is also supported via an on-board RS485 transceiver. The core system board also includes an STMod+ connector for compatible, low cost, small form factor daughter boards associated with the STM32 family, such as the LTE Cell pack.

2.1 Sensing

The core system board offers a comprehensive range of sensors specifically designed to support and enable the Industry 4.0 applications.

Figure 8. STEVAL-STWINKT1 functional block diagram of sensing elements and STM32L4R9ZI6

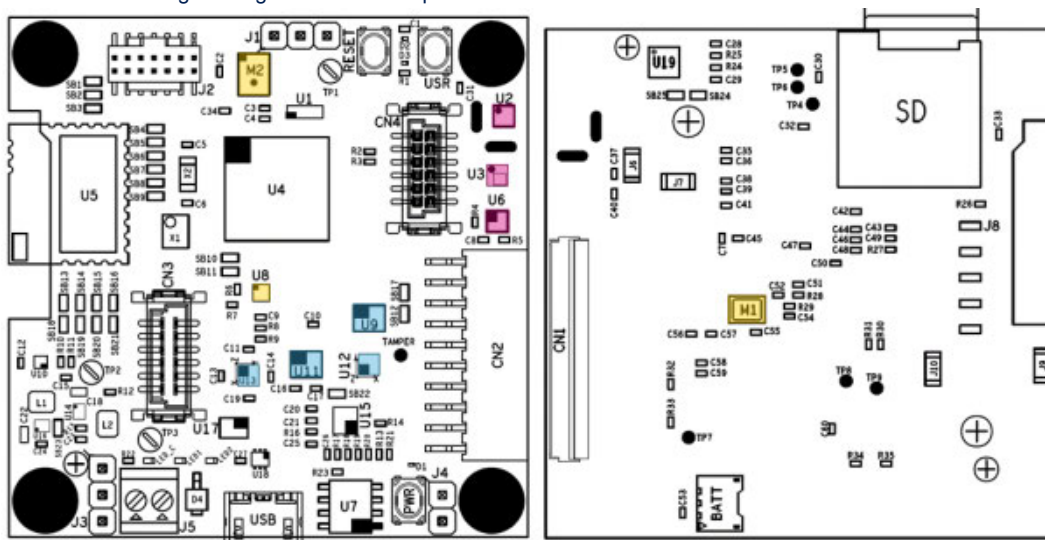

The motion sensors communicate with the [STM32L4R9ZI6](#) microcontroller via SPI in order to accommodate the high data rates, while the magnetometer and environmental sensors communicate via I2C.

The suitably filtered signal from the [MP23ABS1](#) analog microphone is amplified by a [TS922](#) low noise OpAmp and then sampled by the internal 12-bit ADC in the MCU, while the signal from digital microphone is directly managed by the digital filter for Sigma-Delta modulators (DFSDM) interface in the MCU.

2.1.1 HTS221 humidity and temperature sensor

The [HTS221](#) is an ultra-compact relative humidity and temperature sensor with a sensing element and a mixed signal ASIC to provide measurement information through digital serial interfaces.

The sensing element consists of a polymer dielectric planar capacitor structure capable of detecting relative humidity variations and is manufactured using a dedicated ST process.

The HTS221 is available in a small top-holed cap land grid array (HLGA) package guaranteed to operate over a temperature range from -40 °C to +120 °C.

RELATED LINKS

[Visit the product web page for the HTS221 relative humidity and temperature sensor](#)

2.1.2 LPS22HH MEMS pressure sensor

The [LPS22HH](#) is an ultra-compact piezoresistive absolute pressure sensor which functions as a digital output barometer. The device consists of a sensing element and an IC interface which communicates through I²C, MIPI I3CSM or SPI from the sensing element to the application.

The sensing element, which detects absolute pressure, consists of a suspended membrane manufactured using a dedicated process developed by ST.

The LPS22HH is available in a full-mold, holed LGA package (HLGA). It is guaranteed to operate over a temperature range extending from -40 °C to +85 °C.

RELATED LINKS

[Visit the product web page for the LPS22HH MEMS pressure sensor](#)

2.1.3 STTS751 digital temperature sensor

The **STTS751** is a digital temperature sensor which communicates over a 2-wire SMBus 2.0 compatible bus. The temperature is measured with a user-configurable resolution between 9 and 12 bits. At 9 bits, the smallest step size is 0.5 °C, and at 12 bits, it is 0.0625 °C. At the default resolution (10 bits, 0.25 °C/LSB), the nominal conversion time is 21 milliseconds.

Up to eight devices can share the same 2-wire SMBus without ambiguity, allowing a single application to monitor multiple temperature zones.

RELATED LINKS

[Visit the product web page for the STTS751 digital temperature sensor](#)

2.1.4 TS922 rail-to-rail, high output current, dual operational amplifier

The **TS922** is a rail-to-rail dual BiCMOS operational amplifier optimized and fully specified for 3 V and 5 V operation. The very low noise, low distortion, low offset, and high output current capability render this device highly suitable for high quality, low voltage, or battery operated audio systems.

RELATED LINKS

[Visit the product web page for the TS922 rail-to-rail, high output current, dual operational amplifier](#)

2.1.5 ISM330DHCX iNEMO IMU 3D Acc + 3D Gyro

The **ISM330DHCX** is a system-in-package featuring a high-performance 3D digital accelerometer and +3D digital gyroscope tailored for Industry 4.0 applications.

The sensing elements of the accelerometer and of the gyroscope are implemented on the same silicon die, which ensures superior stability and robustness.

Several embedded features such as programmable FSM, FIFO, sensor hub, event decoding and interrupts allow the implementation of smart and complex sensor nodes able to deliver high performance at very low power.

RELATED LINKS

[Visit the product web page for the ISM330DHCX iNEMO IMU 3D Acc + 3D Gyro](#)

2.1.6 IIS3DWB ultra-wide bandwidth (up to 6 kHz), low-noise, 3-axis digital vibration sensor

The **IIS3DWB** is a system-in-package featuring a 3-axis digital accelerometer with low noise over an ultra-wide and flat frequency range. The wide bandwidth, low noise, very stable and repeatable sensitivity, together with the capability of operating over an extended temperature range (up to +105 °C), render the device particularly suitable for vibration monitoring in industrial applications.

The high performance delivered at low power consumption, together with the digital output and embedded digital features like FIFO and interrupts are of primary importance in battery-operated industrial wireless sensor nodes.

RELATED LINKS

[Visit the product web page for the IIS3DWB ultra-wide bandwidth \(up to 6 kHz\), low-noise, 3-axis digital vibration sensor](#)

2.1.7 IIS2DH ultra-low power 3-axis high-performance accelerometer

The **IIS2DH** is an ultra-low-power high-performance three-axis linear accelerometer with digital I2C/SPI serial interface standard output.

The device may be configured to generate interrupt signals from two independent inertial wake-up/free-fall events, as well as from the position of the device itself.

RELATED LINKS

[Visit the product web page for the IIS2DH ultra-low power 3-axis high-performance accelerometer](#)

2.1.8

IIS2MDC 3-axis magnetometer

The **IIS2MDC** is a high-accuracy, ultra-low-power 3-axis digital magnetic sensor. It has a magnetic field dynamic range up to ± 50 gauss, and includes an I²C serial bus interface that supports 100 kHz, 400 kHz, 1 MHz, and 3.4 MHz rates and an SPI serial standard interface.

The device can be configured to generate an interrupt signal from magnetic field detection.

RELATED LINKS

[Visit the product web page for the IIS2MDC 3-axis magnetometer](#)

2.1.9

MP23ABS1 analog MEMS microphone

The **MP23ABS1** is a compact, low-power microphone built with a capacitive sensing element and an IC interface. The device has an acoustic overload point of 130 dB SPL with a typical 64 dB signal-to-noise ratio, with sensitivity at -38 dBV ± 1 dB @ 94 dB SPL, 1 kHz.

RELATED LINKS

[Visit the product web page for the MP23ABS1 analog MEMS microphone](#)

2.1.10

IMP34DT05 digital MEMS microphone

The **IMP34DT05** is an ultra-compact, low-power, omnidirectional, digital MEMS microphone built with a capacitive sensing element and an IC interface; the device features 64 dB signal-to-noise ratio and -26 dBFS ± 3 dB sensitivity.

The IC interface includes a dedicated circuit able to provide a digital signal externally in PDM format.

[Visit the product web page for the IMP34DT05 digital MEMS microphone](#)

2.2

Processing and connectivity

The STWIN core system board features several wired and wireless connectivity options and the **STM32L4R9ZI** ultra-low-power microcontroller, which is part of the STM32L4+ series MCUs based on the high-performance Arm Cortex-M4 32-bit RISC core, operating at up to 120 MHz and equipped with 640 Kb SRAM and 2 MB Flash memory.

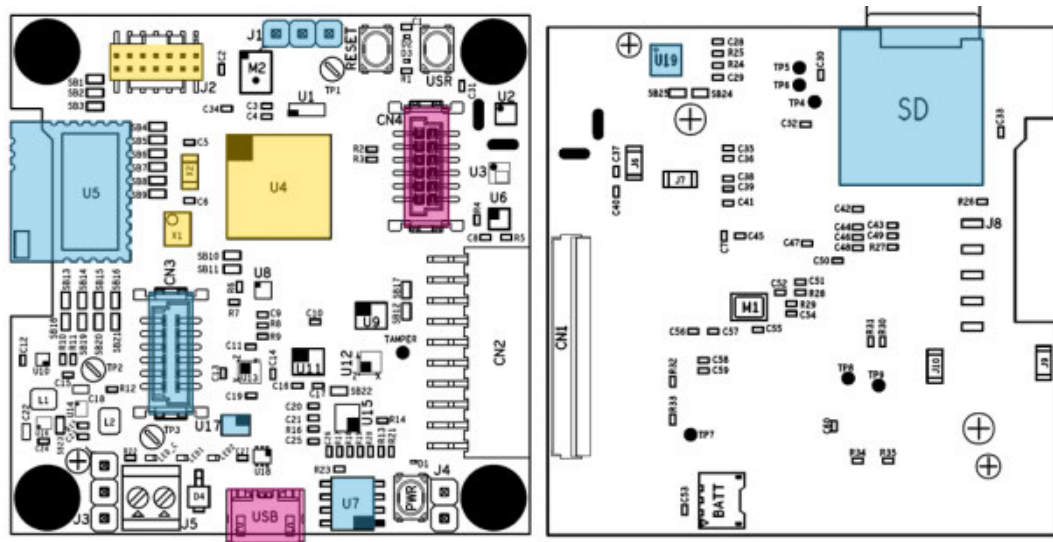

Figure 10. Main connectivity components and the STM32L4R9ZI processing unit

Each connectivity component is connected to an independent bus on the STM32L4R9ZI MCU, so they can all be configured individually.

2.2.1 STM32L4R9ZI Cortex-M4F 120MHz 640Kb RAM

The STM32L4R9ZI devices is an ultra-low-power microcontroller (STM32L4+ Series MCU) based on the high-performance Arm Cortex-M4 32-bit RISC core, which operates at a frequency of up to 120 MHz.

The Cortex-M4 core features a single-precision floating-point unit (FPU), which supports all the Arm single-precision data-processing instructions and all the data types. The Cortex-M4 core also implements a full set of DSP (digital signal processing) instructions and a memory protection unit (MPU) which enhances application security.

These devices embed high-speed memories (2 Mbytes of Flash memory and 640 Kbytes of SRAM), a flexible external memory controller (FSMC) for static memories (for devices with packages of 100 pins and more), two OctoSPI Flash memory interfaces and an extensive range of enhanced I/Os and peripherals connected to two APB buses, two AHB buses and a 32-bit multi-AHB bus matrix.

The MCU embeds several protection mechanisms for embedded Flash memory and SRAM: readout protection, write protection, proprietary code readout protection and a firewall.

These devices offer a fast 12-bit ADC (5 Msps), two comparators, two operational amplifiers, two DAC channels, an internal voltage reference buffer, a low-power RTC, two general-purpose 32-bit timer, two 16-bit PWM timers for motor control, seven general-purpose 16-bit timers, and two 16-bit low-power timers. The devices support four digital filters for external sigma delta modulators (DFSDM). In addition, up to 24 capacitive sensing channels are available.

They also feature standard and advanced communication interfaces such as:

- Four I2Cs
- Three SPIs
- Three USARTs, two UARTs and one low-power UART
- Two SAIs
- One SDMMC

- One CAN
- One USB OTG full-speed
- Camera interface
- DMA2D controller

The device operates in the -40 to +85 °C (+105 °C junction) and -40 to +125 °C (+130 °C junction) temperature ranges from a 1.71 to 3.6 V for V_{DD} power supply when using internal LDO regulator and a 1.05 to 1.32 V V_{DD12} power supply when using external SMPS supply. A comprehensive set of power-saving modes allows the design of low-power applications.

Some independent power supplies are supported, such as an analog independent supply input for ADC, DAC, OPAMPs and comparators, a 3.3 V dedicated supply input for USB and up to 14 I/Os, which can be supplied independently down to 1.08 V. A VBAT input allows backup of the RTC and the registers. Dedicated V_{DD12} power supplies can be used to bypass the internal LDO regulator when connected to an external SMPS.

RELATED LINKS

[Visit the product web page for the STM32L4R9ZI microcontroller](#)

2.2.2 SPBTLE-1S application module for Bluetooth v4.2

The **SPBTLE-1S** is a Bluetooth low energy system-on-chip application processor certified module, compliant with BT specifications v4.2 and BQE qualified. It supports multiple roles simultaneously and can act as a Bluetooth smart master and slave device at the same time.

The module is based on the BlueNRG-1 system-on-chip, with the entire Bluetooth low energy stack and protocols embedded in the module to provide a complete RF platform in a tiny form factor. The integrated radio, embedded antenna and high frequency oscillators complete the certified solution that can help minimize the time to market of final applications.

The SPBTLE-1S can be powered directly with a pair of AAA batteries or any power source from 1.7 to 3.6 V.

RELATED LINKS

[Visit the product web page for the SPBTLE-1S application module for Bluetooth v4.2](#)

2.2.3 STR485LV 3.3V RS485 up to 20Mbps

The **STR485** is a low power differential line transceiver for RS485 data transmission standard applications in half-duplex mode. Data and enable signals are compatible with 1.8 V or 3.3 V supplies.

Two speeds are selectable via the SLR pin: fast data rate up to 20 Mbps or slow data rate up to 250 kbps for extended cables.

Excessive power dissipation caused by bus contention or faults is prevented by a thermal shutdown circuit that forces the driver outputs into a high impedance state. The receiver has a fail-safe feature that guarantees a high output state when the inputs are left open, shorted or idle.

RELATED LINKS

[Visit the product web page for the STR485LV 3.3V RS485 up to 20Mbps](#)

2.2.4 USB connector

The Micro-USB connector on the board can be used for both power supply and data transfer (USB Device only). Different examples of USB class implementation can be found in STSW-STWINKT01 software package.

2.2.5 STSAFE-A110 (footprint only) authentication, state-of-the-art security for peripherals and IoT devices

The **STSAFE-A110** is a highly secure solution that acts as a secure element providing authentication and secure data management services to a local or remote host. It consists of a full turnkey solution with a secure operating system running on the latest generation of secure microcontrollers.

The **STSAFE-A110** can be integrated in IoT devices, smart-home, smart-city and industrial applications, consumer electronics devices, consumables and accessories.

RELATED LINKS

Visit the product web page for the STSAFE-A110 authentication, state-of-the-art security for peripherals and IoT devices

2.2.6 microSD card socket

On the bottom side of the STWIN core system board is a microSD Card socket that is accessible even when the board is mounted in the plastic box. The card is accessed through a 4-bit wide SDIO port for maximum performance.

A couple of firmware examples involving high speed data logging on the SD card are available in the [STSW-STWINKT01](#) software package.

2.2.7 Clock sources

There are two external clock sources on the STWIN core system board:

- X1: 16 MHz high speed external (HSE) oscillator for the MCU.
- X2: 32.768 kHz low speed external (LSE) oscillator for the RTC embedded in the MCU.

2.3 Power management

The STWIN core system board includes a range of power management features that enable very low power consumption in final applications.

Figure 12. Power and protection components

Figure 13. Power and protection component locations

U1: EMIF06-MSD02N16 6-line EMI filter and ESD protection for T-Flash and microSD card interfaces

2.3.1 Battery connectors

The battery supply voltage (VBAT) may be provided by connecting the 480 mA LiPo battery included in the STWIN kit to the dedicated battery connector, or by supplying an external voltage through the J4 connector.

Figure 14. Battery and J4 connectors for VBAT supply

2.3.2 Power Supply

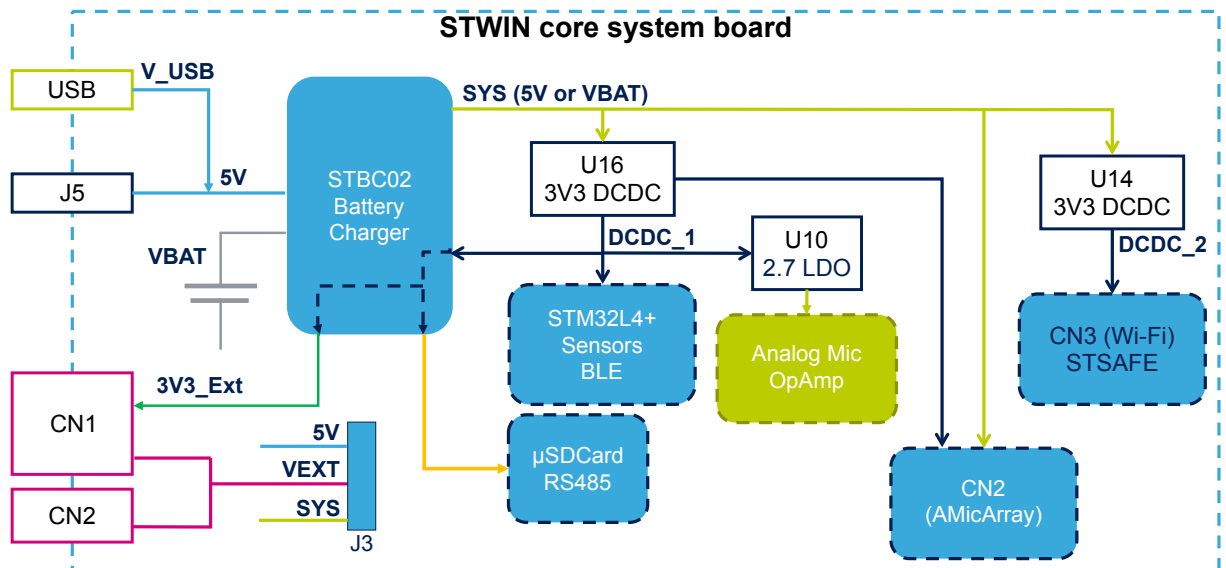

The STWIN core system board can receive power through several sources:

- V_USB: through micro USB connector [5V]

- 5V: through J5 connector [5V]
- V_EXT: through CN1 or CN2 [5V]
- VBAT: LiPo Battery connected to BATT connector

The battery is always optional. The **STBC02** battery charger automatically checks the available power inputs and selects one to power the system. When the battery is connected as well as one of the other sources, the STBC02 automatically charges the battery.

Figure 15. Power circuits

2.3.3 Power ON/OFF procedure

If the STWIN core system board is not powered via battery, then the board will turn on and off when you connect and disconnect an external supply, respectively.

Follow the steps below to power the board on and off when it is powered by a LiPo battery.

- Step 1.** Push the PWR button for about a second to power the board on.
Power on is managed by the **STBC02** battery charger WAKE-UP hardware feature.
- Step 2.** Push the PWR button again to turn the board off.
In the application code examples provided with the software, the microcontroller detects the push action and activates the battery charger SHUTDOWN command to switch the power supply off.

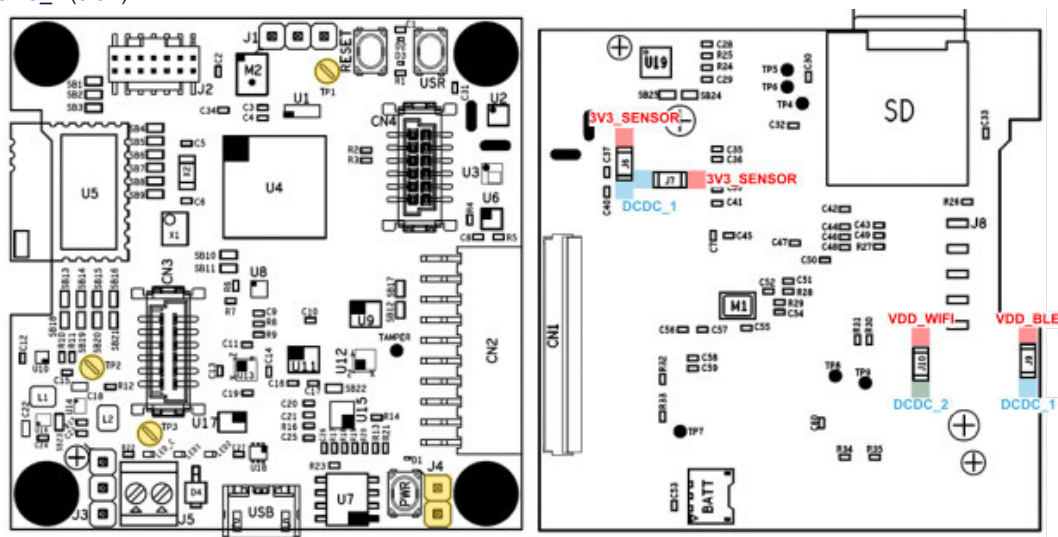

2.3.4 Power consumption evaluation

There are several test points and jumpers on the STWIN core system board available to monitor the electrical performance of running applications. In particular, there are four jumpers for monitoring the current consumption in each of the four main power supply domains on the board.

The best way to evaluate general power consumption is to remove both the battery and the USB cable and provide 5 V directly on the J5 connector.

Figure 16. Power monitoring points

20	GPIO ⁽⁷⁾	Output / Input

1. If two functions are provided on a STMod+ connector pin, you can connect two different I/O ports from STM32: the firmware manages the conflicts that may arise. MOSIs means used in Serial Daisy Chained-SPI mode and MOSIp means used in Parallel SPI mode. More alternate functions may be available from STM32, refer to the User manual of the host board and the corresponding STM32 datasheet available on www.st.com.
2. Instead of SPIx_NSS, a GPIO can be used as SPI Chip Select.
3. Pins 2 and 8 are the same SPIx_MOSI signals, but they must come from two different I/O ports.

4. Pins 3 and 9 are the same SPIx_MISO signals, but they must come from two different I/O ports.
5. Power Supply is Output or Input, depending on host / daughterboard configuration.
6. INT is an interrupt line.
7. GPIO ports with many alternate functions (like UART, I²C, SPI and analog inputs/outputs) are privileged to offer optimum flexibility.

2.6 STLINK-V3MINI debugger and programmer for STM32

The [STLINK-V3MINI](#) is a standalone debugging and programming mini probe for STM32 microcontrollers, with JTAG/SWD interfaces for communication with any STM32 microcontroller located on an application board. It provides a Virtual COM port interface for host PCs to communication with target MCUs via UART. The STLINK-V3MINI is supplied with an STDC14 to STDC14 flat cable.

Figure 22. STLINK-V3MINI and STDC14 cable

3 STWIN assembly steps

To assemble your SensorTile Wireless Industrial Node, you need the following components:

- STWIN core system board
- 4x M3 bolts and nuts
- Plastic box (2 parts)
- Battery
- 2x Magnets (optional - not included in the kit):
 - RS Stock No. 177-4040 Brand Eclipse Mfr Part No.N859

Figure 23. Exploded cad drawing of STWIN node components

- Step 1.** (Optional) Insert the magnets in the rectangular recesses in the bottom of the main case.

Figure 24. Optional magnets inserted in main case

- Step 2.** Slide the U-shaped bracket into the main case.
This will secure the magnets if they are present.
- Step 3.** Insert the STWIN core system board with the correct orientation.

Figure 25. Core system board inserted in main case

Step 4. Fasten the core system board to the case using the nuts and bolts provided with the kit.

Figure 26. Core system board fastened with bolts

4 How to run the default Predictive_Maintenance_BLE application

The Predictive_Maintenance_BLE application is part of the [FP-IND-PREDMNT1 STM32Cube](#) function pack.

It allows developing a sensor node for condition monitoring and predictive maintenance applications, featuring digital or analog microphone, environmental and motion sensors, and performing real-time monitoring of parameters and equipment status via BLE connectivity.

It also shows an example of the signal processing (MotionSP) middleware for vibration analysis in time domain (speed RMS and acceleration peak) and frequency domain (FFT with programmable size, averaging, overlapping and windowing).

Predictive_Maintenance_BLE is compatible with [STBLESensor](#) application for Android/iOS.

The software gathers the temperature, humidity, pressure, audio, motion sensor drivers for the [HTS221](#), [LPS22HH](#), [MP23ABS1](#), [IIS3DWB](#), [ISM330DHCX](#) devices.

When you first press the reset button, the Predictive_Maintenance_BLE application:

- checks whether all the sensors are present and working
- reads the Meta Data Manager
- initializes the connectivity and creates a random BLE MAC address
- initializes the BLE hardware service (adding the temperature, humidity, pressure, 3Dgyroscope, 3D magnetometer, 3D accelerometer and microphone characteristics) and the BLE software service
- initializes the BLE console service adding the stdin/stdout and stderr characteristics
- shows the vibration parameter values present in the Flash memory and sets the accelerometer parameters

For control and debugging, you can link the STWN core system to the PC through a USB cable and set a terminal window up for the appropriate UART communication port, used to control the initialization and the execution phases, setting the parameters as follows: 8N1, 115200 bauds, no hardware flow control, line endings LF or CR-LF (Transmit) and LF (receive).

When an Android/iOS device is connected to the STWIN Core System board, you can control data transmitted through the board.

Revision history

Table 6. Document revision history

Date	Version	Changes
11-Sep-2019	1	Initial release.
04-Feb-2020	2	Updated Section 2.1 Sensing and Section 2.1.6 IIS3DWB ultra-wide bandwidth (up to 6 kHz), lownoise, 3-axis digital vibration sensor. Added Section 4 How to run the default Predictive_Maintenance_BLE application.
04-Jun-2020	3	Updated Figure 1. STEVAL-STWINKT1 SensorTile Wireless Industrial Node, Section 2.2.5 STSAFE-A110 (footprint only) authentication, state-of-the-art security for peripherals and IoT devices, Section 5 Schematic diagrams and Section 6 Bill of materials.

Contents

1	STWIN kit components	2
2	Functional blocks	4
2.1	Sensing	4
2.1.1	HTS221 humidity and temperature sensor	5
2.1.2	LPS22HH MEMS pressure sensor	5
2.1.3	STTS751 digital temperature sensor	6
2.1.4	TS922 rail-to-rail, high output current, dual operational amplifier	6
2.1.5	ISM330DHCX iNEMO IMU 3D Acc + 3D Gyro	6
2.1.6	IIS3DWB ultra-wide bandwidth (up to 6 kHz), low-noise, 3-axis digital vibration sensor	6
2.1.7	IIS2DH ultra-low power 3-axis high-performance accelerometer	6
2.1.8	IIS2MDC 3-axis magnetometer	7
2.1.9	MP23ABS1 analog MEMS microphone	7
2.1.10	IMP34DT05 digital MEMS microphone	7
2.2	Processing and connectivity	7
2.2.1	STM32L4R9ZI Cortex-M4F 120MHz 640Kb RAM	9
2.2.2	SPBTLE-1S application module for Bluetooth v4.2	10
2.2.3	STR485LV 3.3V RS485 up to 20Mbps	10
2.2.4	USB connector	10
2.2.5	STSAFE-A110 (footprint only) authentication, state-of-the-art security for peripherals and IoT devices	10
2.2.6	microSD card socket	11
2.2.7	Clock sources	11
2.3	Power management	11
2.3.1	Battery connectors	12
2.3.2	Power Supply	12
2.3.3	Power ON/OFF procedure	13
2.3.4	Power consumption evaluation	13
2.4	Buttons, LEDs and connectors	15
2.4.1	Flex expansion connector	15
2.4.2	STMod+ connector	17
